## Electrical control

### Remote automatic type (A)

- PLC is used as the control core, thus realizing high reliability and powerful function. Imported control components are used to realize sensitive and reliable control.
- Automatically monitor cold water outlet temperature; automatically control, increase and decrease the loads on solenoid valves via the PLC, reduce energy consumption and control water outlet temperature with high accuracy.
- The closed-loop direct digital control (DDC) mode is used for PLC, which can thus realize fully automatic computerized regulation and control in the whole process as well as more accurate and reliable control of units.
- The PLC program can be adjusted rapidly as needed by users, and the control program is flexible and convenient, thus meeting the user's actual demand to the greatest extent possible.
- The use skill in the control system can be mastered very quickly by referring to the specification; the man-machine interface uses a touch screen to realize simple and convenient operation.
- The unit has self-diagnosis function; when some parameters approach their limit values, the unit will take certain protective measures and give an alarm to prevent the unit from being damaged and minimize nonscheduled downtime.
- Automatic recording and saving of fault alarming and occurrence time of units, giving a fault treatment prompt.
- Optional configuration: units have open network communication interfaces in addition to the above functions.
  - Two-way communication with automatic building control system or upper machine system;
  - Coordinated operation of multiple units and multi-machine control (group control);
  - Remote monitoring of a single unit or multiple units can be realized in different cities or regions via telephone network or Internet.
